## **Merge Sort**

Write a Python program to sort a list of elements using the merge sort algorithm.

#### For example:

Input	Result
5 6 5 4 3 8	3 4 5 6 8

```
a=int(input())
l=[]
l.extend(input().split())
for i in range(a-1):
    for j in range(a-1):
        if(int(l[j])>int(l[j+1])):
        t=int(l[j])
        l[j]=int(l[j+1])
        l[j+1]=t
for i in range(a):
    print(int(l[i]),end=" ")
```

	Input	Expected	Got
<b>~</b>	5 6 5 4 3 8	3 4 5 6 8	3 4 5 6 8
<b>~</b>	9 14 46 43 27 57 41 45 21 70	14 21 27 41 43 45 46 57 70	14 21 27 41 43 45 46 5
<b>~</b>	4 86 43 23 49	23 43 49 86	23 43 49 86

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

## **Bubble Sort**

Given an listof integers, sort the array in ascending order using the *Bubble Sort* algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

Array is sorted in 3 swaps.

First Element: 1 Last Element: 6

#### **Input Format**

The first line contains an integer, n, the size of the <u>list</u> a. The second line contains n, space-separated integers a[i].

#### Constraints

- · 2<=n<=600
- $1 \le a[i] \le 2x10^6$ .

#### **Output Format**

You must print the following three lines of output:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

#### Sample Input 0

3

123

#### Sample Output 0

List is sorted in 0 swaps.

First Element: 1 Last Element: 3

### For example:

Input	Result
3 3 2 1	List is sorted in 3 swaps. First Element: 1 Last Element: 3
5 19284	List is sorted in 4 swaps. First Element: 1 Last Element: 9

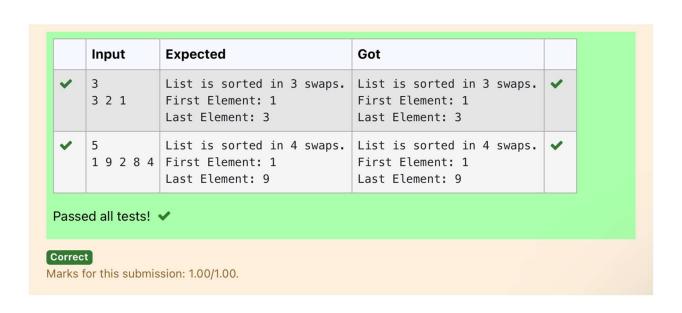

```
def bubble_sort(arr):
  n = len(arr)
  swaps = 0
  for i in range(n):
     for j in range(0, n-i-1):
       if arr[j] > arr[j + 1]:
          # Swap elements
          arr[j], arr[j + 1] = arr[j + 1], arr[j]
          swaps += 1
  return swaps
# Input the size of the list
n = int(input())
# Input the list of integers
arr = list(map(int, input().split()))
# Perform bubble sort and count the number of swaps
```

num\_swaps = bubble\_sort(arr)

```
# Print the number of swaps
print("List is sorted in", num_swaps, "swaps.")

# Print the first element
print("First Element:", arr[0])

# Print the last element
print("Last Element:", arr[-1])
```

## **Peak Element**

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

 $A[i-1] \le A[i] \ge a[i+1]$  for middle elements.  $[0 \le i \le n-1]$ 

 $A[i-1] \le A[i]$  for last element [i=n-1]

A[i] > = A[i+1] for first element [i=0]

#### **Input Format**

The first line contains a single integer n, the length of A.

The second line contains n space-separated integers, A[i].

### **Output Format**

**Print** peak numbers separated by space.

#### Sample Input

5

891026

#### Sample Output

106

## For example:

Input	Result
4 12 3 6 8	12 8

def find\_peak(arr):

peak\_elements = []

```
# Check for the first element
  if arr[0] >= arr[1]:
    peak_elements.append(arr[0])
  # Check for middle elements
  for i in range(1, len(arr) - 1):
    if arr[i - 1] \le arr[i] >= arr[i + 1]:
       peak_elements.append(arr[i])
  # Check for the last element
  if arr[-1] >= arr[-2]:
    peak_elements.append(arr[-1])
  return peak_elements
# Input the length of the list
n = int(input())
# Input the list of integers
arr = list(map(int, input().split()))
# Find peak elements and print the result
peak_elements = find_peak(arr)
print(*peak_elements)
```

# **Binary Search**

Write a Python program for binary search.

## For example:

Input	Result
12358	False
3 5 9 45 42 42	True

a = input().split(",")
b = input()

print(b in a)

## **Frequency of Elements**

To find the frequency of numbers in a list and display in sorted order.

#### **Constraints:**

1<=n, arr[i]<=100

#### Input:

 $1\;68\;79\;4\;90\;68\;1\;4\;5$ 

#### output:

12

42

5 1

68 2

79 1

90 1

## For example:

Input	Result
4 3 5 3 4 5	3 2 4 2 5 2

def count\_frequency(arr):

 $frequency = {}$ 

```
# Count the frequency of each number in the list
for num in arr:
    frequency[num] = frequency.get(num, 0) + 1

# Sort the dictionary based on keys
    sorted_frequency = sorted(frequency.items())

# Print the frequency of each number
for num, freq in sorted_frequency:
    print(num, freq)

# Input the list of numbers
arr = list(map(int, input().split()))

# Count the frequency and print the result
count_frequency(arr)
```

4 3 5 3 4 5 3 2 3 2 <b>4</b> 2 4 2
5 2 5 2
12 4 4 4 2 3 5     2 1     2 1       3 1     3 1       4 3     4 3       5 1     5 1       12 1     12 1
5 4 5 4 6 5 7 3     3 1       4 2     4 2       5 3     5 3       6 1     6 1       7 1     7 1
